RESTAURANT ONLINE MENU

PROJECT BRIEF

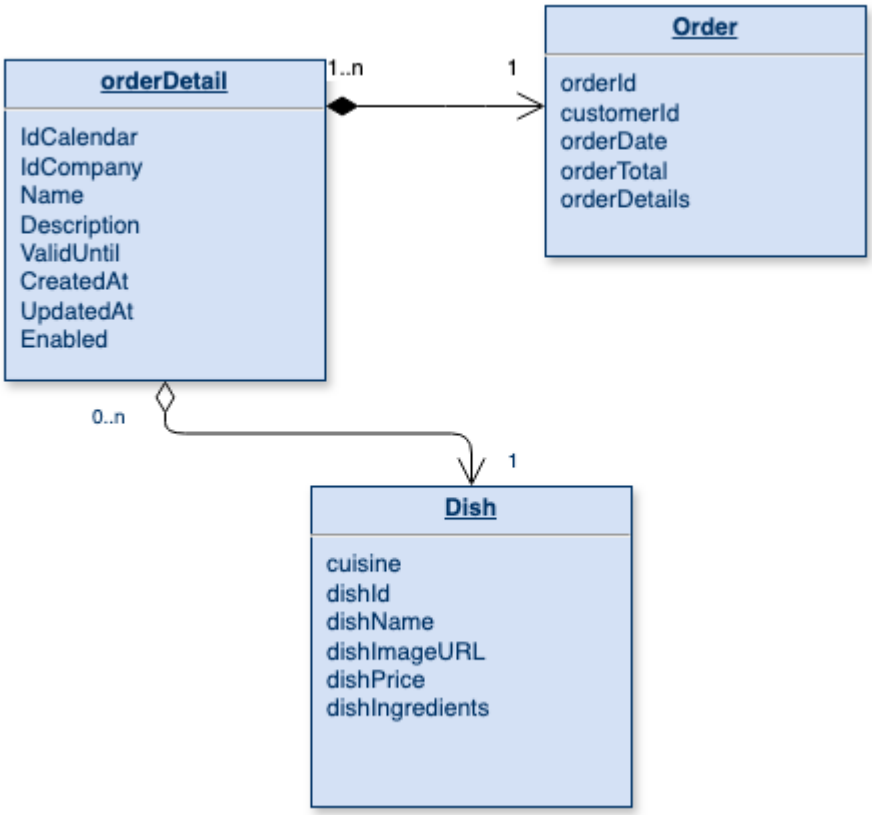
Teacher Mikko Apiola
Student: Nguyen An Ninh

March-2025

I. General description. What is the purpose of the project, and who are the potential users of the software? (Minimum: 2 paragraphs)

- The purpose of this application is serving guests at a multi-cuisine restaurant when they are on-premises or reserve a menu online beforehand. It helps to reduce effort of waiter/waitress and increasing readiness of kitchen and chefs.
- The application gives the best convenience to the user by do not requesting too much information to start using it. It only requires a phone number to indicate as the customer Id.
- The application gives a visualized view with beautiful images. The users can access all their orders.

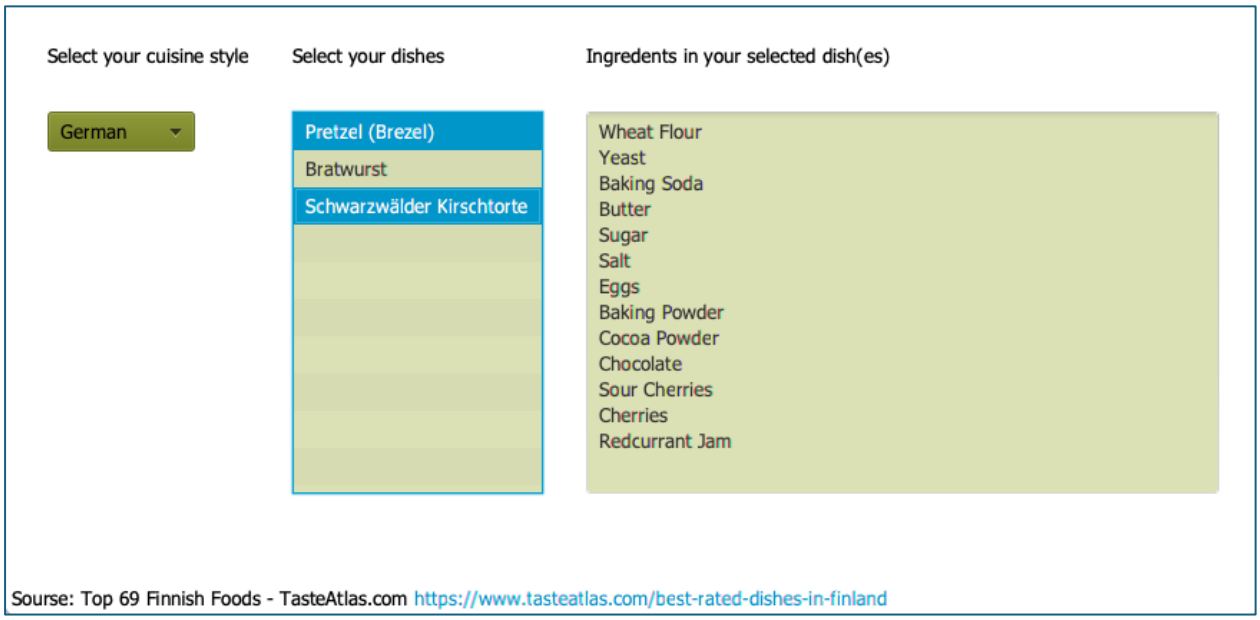
II. A visualization and/or a clear textual description of the Java – classes used in the project. Explain the purpose of each class.



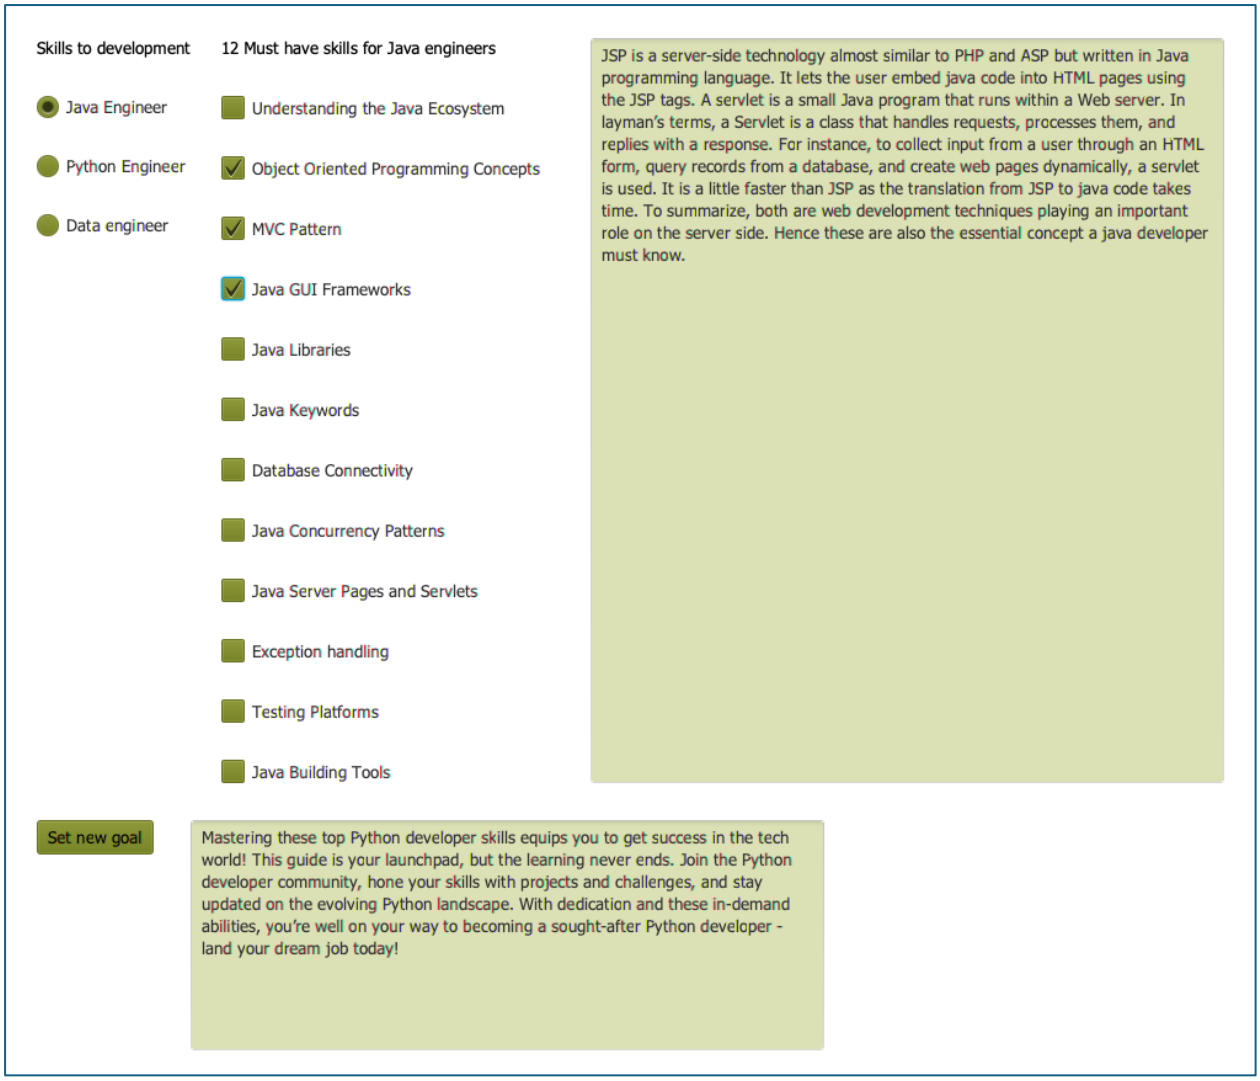
- Order: to store all orders from the restaurant. Data is Order Id, Customer Id, Order Date, Order Total and all Order Detail
- Order Detail: store detailed order such as reserved dishes, quality of dish
- Dish: store all available dish can be served by the restaurant and reserved by the users

III. Brief story of project evolution (Minimum: 2 paragraphs)

- This project is based on a functional idea from Task #2and XML handling from Task #1 of Exercise #7. It then had a significant elaboration by adding more functionalities and visualization listed in project brief



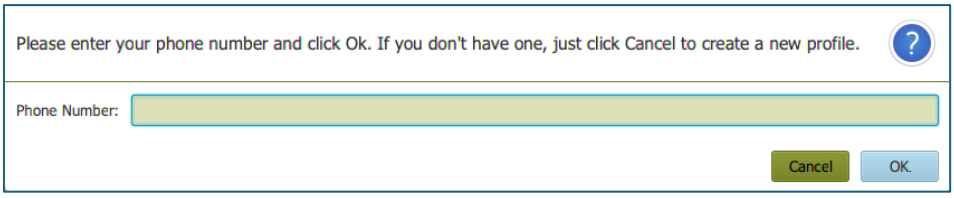
Task #2



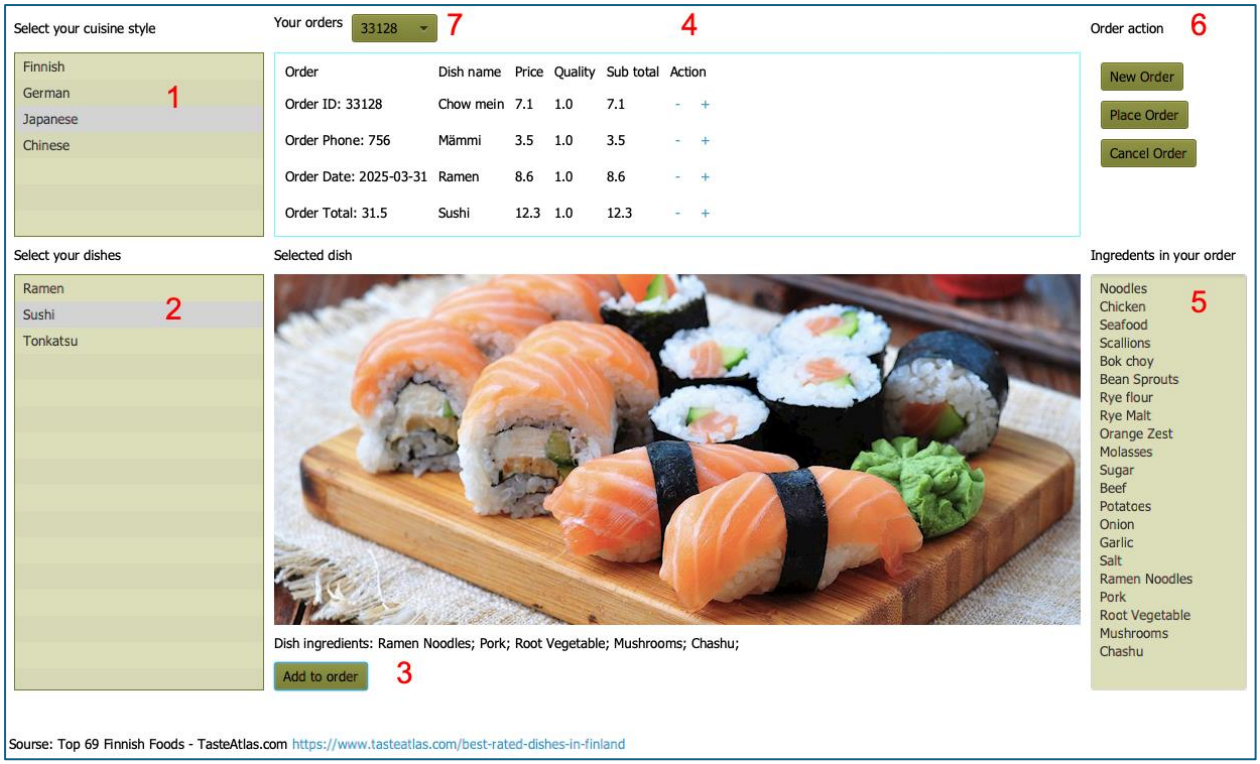
Task #1

- Added-in functionality at the beginning just allows users to select dishes and see ingredients of all selected dishes. Decorated by some images. Then I decided to separate orders from users by allowing input phone number.
- After that, I saw if the users are only working on only one order is not good, so I added more '**New Order**', '**Submit Order**' and '**Cancel Order**'.
- By adding some new functions, the application raised so many issues that it needs to refactor the structure as well as logical error. I spent a lot of time making it smoother and more friendly, and easier to use.

IV. Screenshots of the UI.



Login layout



Main layout

V. Usage instructions for a novice user. (Minimum: 1 paragraph)

To use the application, first give the phone number on login layout, then follow the marked numbers on the main layout.

A. Login:

1. Put the phone number to view all existing order, click **OK**.
2. If this is the first time it has been used, users can put the phone number, click **OK** or simpler click on **Cancel** button, the application will create a brand-new profile.

B. Working with Orders:

1. Select cuisine style (Finland, German or Chinese)
2. Select a dish on selected cuisine style
3. Click Add to order. The app will add a new line on section #4 or increase quality if the dish is added before. The users also click on '**-**' or '**+**' sign to modify dish's quality. If the dish has quantity equals to 1 and the user click on '-' sign, the app will automatically remove this dish out
4. The users can view all ingredients from all selected dishes to see if there is any ingredient that may cause allergies.
5. After finish choosing dish in desired order, the users can click on **Place Order** to submit order, start a whole new order by click on **New Order**, or cancel an existing order by click on **Cancel Order**

6. The users can access previous order from dropdown at section #7

VI. Self-evaluation of the project. What are the positive aspects of the project? What about challenges or problems? (Minimum: 1 paragraph)

- To think about this idea, I must put myself as an end-user who direct use the app. Focus on what users may expect on the app. After putting some control onto the form, it is not convenience for the users and difficult to understand the flow, so I re-arranged the form more clearly and connected.

VII. Further development. How could / should the project be developed? (Minimum: 1 paragraph

- Allow users to access the app remotely. Currently, limited to technical skill, the app could not read and online XML file as its database
- Allow users to filter order by status, order date and so on.
- Save profile of logged in user for quick access next time or switch to another profiles
